Winter Semester 2023/24

version: 407/06 - 10/23/24 04

- For any regular language, there is a unique *minimal* DFA
- By finding the minimal DFA, we can also prove equivalence (or not) of different FSA and the languages they recognize
- In general the idea is:
  - Throw away unreachable states (easy)
  - Merge equivalent states
- There are two well-known algorithms for minimization:
  - Hopcroft's algorithm: find and eliminate equivalent states by partitioning the set of states
  - Bronzowski's algorithm: 'double reversal'

C. Çöltekin, INF | University of Tübingen

Winter Semester 2023/24 1/7

Introduction Minimization by partitioning Bronzowski's algorithm

## Finding equivalent states

Intuition

The edges leaving the group of nodes are identical.  
Their *right languages* are the same.

C. Çöltekin, INF | University of Tübingen

Winter Semester 2023/24 1/7

Introduction Minimization by partitioning Bronzowski's algorithm

## Finding equivalent states

Intuition

The edges leaving the group of nodes are identical.  
Their *right languages* are the same.

Winter Semester 2023/24 1/7

Introduction Minimization by partitioning Bronzowski's algorithm

## Minimization by partitioning

- Accepting & non-accepting states form a partition  
 $Q_1 = \{0, 1, 2, 3\}$ ,  $Q_2 = \{4, 5\}$
- For any of the nodes in a set, if any symbol leads to different sets of nodes, split
- $Q_1 = \{0, 3\}$ ,  $Q_2 = \{1\}$ ,  $Q_3 = \{2, 4, 5\}$
- Stop when we cannot split any of the sets, merge the indistinguishable states

C. Çöltekin, INF | University of Tübingen

Winter Semester 2023/24 1/7

Introduction Minimization by partitioning Bronzowski's algorithm

## Minimization by partitioning

tabular version

- Create a state-by-state table, mark distinguishable pairs:  $(q_1, q_2)$  such that  $\{A(q_1, x), A(q_2, x)\}$  is a distinguishable pair for any  $x \in \Sigma$

- Merge indistinguishable states
- The algorithm can be improved by choosing which cell to visit carefully

## Brzozowski's algorithm

double reverse (r), determinize (d)

## An exercise

find the minimum DFA for the automaton below

## Minimization algorithms

final remarks

- There are many versions of the 'partitioning' algorithm. General idea is to form equivalence classes based on right-language of each state.
- Partitioning algorithm has  $O(n \log n)$  complexity
- 'Double reversal' algorithm has exponential worst-time complexity
- Double reversal algorithm can also be used with NFAs (resulting in the minimal equivalent DFA - NFA minimization is intractable)
- In practice, there is no clear winner, different algorithms run faster on different input
- Reading suggestion: Hopcroft and Ullman (1979, Ch. 2&3), Jurafsky and Martin (2009, Ch. 2)

Next:

- PST
- PSA and regular languages
